

ACCESSION NR: AT4033628

provide the correct answer to each question. The evaluation is made according to the relative number of correct answers by the student, with consideration of the time taken in replying. All the units of the machine are designed in two versions: the first uses telephone relays as logical elements; the second - semiconductors. Both types are described on the basis of block diagrams accompanying the text. Also described in the article is the "Repetitor" teaching machine, designed for foreign language instruction in the higher institutes of learning (the so-called "vuz") and in the lower-echelon schools. The answer is introduced into the machine by means of a keyboard arrangement. The authors discuss the difficulties created by this form of machine address in terms of the special features and peculiarities of foreign language teaching. Of the two types of programs (linear and ramified) which are commonly used for teaching machines, the "Repetitor" employs the ramified or "expanded" type. Sequential "blocks" of information are fed to the student, depending on the degree of accuracy with which he answers the questions contained in the preceding "blocks". Two operating conditions are possible: one in which the student sets for himself the rate or "tempo" of teaching; the other, in

Card 3/5

ACCESSION NR: AT4033628

which this rate is established by the machine itself. Work is evaluated on the basis of a four-point scale ("excellent", "good", "satisfactory" and "poor") as a function of: 1) the number of errors made by the student in completing the exercises on a given subject theme; 2) the reaction time of the student; 3) the number of requests to the machine for "help" (this accomplished by depressing a special button marked "assistance" on the control panel of the machine, resulting in the supplying of either a leading question or of additional information). A block diagram of the "Repetitor" teaching machine is presented and the operation of the basic units of the device are analyzed, along with a discussion of the algorithm used. Noting that this machine is a partially self-adapting teaching device, the authors express the opinion that it would be expedient to construct a test model on the basis of the design described in the article, placing it into actual practice under academic conditions and then modifying and improving it. Orig. art. has: 13 figures.

TITLE: Student design bureau [Teaching machines and programmed teaching]

SOURCE: Ref. zh. Kibernetika, Abs. 3G287K

REF SOURCE: Studencheskoye konstruktorskoye byuro [Obuchayushchiye mashiny i programmirovannoye obuchenije]. Sb. 2. (Tr. Mosk. energ. in-ta, vyp. 58). M., 1965, 186 str.

TOPIC TAGS: programmed teaching, teaching machine, automatic control technology

ABSTRACT: A large part of this anthology is devoted to theoretical and experimental projects dealing with teaching machines and programmed teaching. Considerable attention is paid to the development of new principles of analog-discrete converters and to the design of automatic controllers. Several of the articles deal with theoretical and applied advantages of various devices of computer engineering. V. M. [Translation of abstract]

KUSHELEVSKI B. P. Notes on leptospirosis without jaundice Soviet Medicine, Moscow  
1949, 4 (29)

Epidemics occur in villages, field mice being carriers, and the author proposes to call  
the disease: 'water-field leptospirosis'. Epigastralgia is a characteristic symptom  
and the liver is usually enlarged.

234. **Symptomatology and Diagnosis of Thrombosis of the Renal Artery.** (К симптоматологии и диагностике тромбоза почечных артерий)  
**B. P. KUSHELEVSKY and S. S. BARATE.** Клиническая Медицина [*Klin. Med., Mosk.*] 28, No. 6, 39-45, June, 1950. 2 figs., 11 refs.

The author reviews the literature on occlusion of the renal artery. His own work is based on a study of the condition in 13 men and 8 women, aged between 24 and 70 years, in 11 of whom the left renal artery was blocked, in 9 the right, and in 2 both. In the period during which the series was collected renal-artery occlusion (confirmed post mortem) caused as many deaths as coronary occlusion in the authors' Sverdlovsk clinic. Thrombosis and embolism result either from cardiac disease or from arteriosclerosis, with an intercurrent infection such as influenza as a common precipitating cause.

The patient's general condition is one of collapse with vomiting and subsequent pyrexia, as in coronary embolism. The local signs and symptoms are those of an "acute abdomen", with pain, reflex rigidity, and ileus. There is oliguria or, in the uncommon bilateral cases, anuria. While albumin and blood may be present in the urine, they will not be found if the affected kidney is secreting no urine at all. Frequently there is a sudden, severe rise in blood pressure, due to renal ischaemia. Hyperprothrombinaemia is present. In all cases a condition predisposing the patient to thrombosis or embolism can be found.

KUSKELEVSKI, D. P.  
(# 279)

Hypertensie na trauma capitis Hypertension following a head injury Terap. Arkh. 1951, 3 (3-15)

Various observations made during the war showed that hypertension often occurs during the subacute stage following cranial injury (the incidence varies from 3 to 63% of cases). In 9% of hypertensives (and in 16% of young patients), the history includes cranial injury (Istamanova). Clinical symptoms of a hypopitoco-diencephalic nature are characteristic: hyperhidrosis, subfebrile conditions, tachycardia (sometimes paroxysmal), cardialgia, vitiligo, early occurrence of trichopoliosis, diabetes insipidus, bulimia, cachexia and sometimes bronchial asthma. These symptoms are more predominant in hypertension 'post-traumatic' than in essential hypertension. Irradiation of the diencephalon may be useful; e.g. it may alleviate the cardialgia. The injured cerebral parts are foci of cortical inhibition, as a result of which the 'tone' of the subcortical autonomic centre is increased in such a manner that signs of irritation of the autonomic nervous system occur (Miasnikov). When the individual is subject to special strain - i.e. when unusually strong stimuli from the periphery continuously reach the centres affected - hypertension occurs. This may take place some considerable time after injury.

AUTHOR: Kushenskiy, K.S., Mining Engineer 127-58-1-13/28

TITLE: Rail-Less Transport in Underground Mines (Bezrel'-sovyy transport na podzemnykh rudnikakh). According to Data From Foreign Literature (Po dannym inostrannoy literatury)

PERIODICAL: Gornyy Zhurnal, 1958, Nr 1, pp 44-51 (USSR)

ABSTRACT: The article represents a review of foreign magazines in the field of mining transport. The reviewer's conclusion is that the experience of mines in the USA, Canada, England, France and other countries shows that the application of rail-less transport and other self-propelled equipment (drilling and loading machines, etc) makes it possible to increase ore output and labor efficiency considerably, and to reduce the cost of operations. The article contains 6 figures, 5 photos, and 21 references, of which 1 is Soviet, 3 German and 17 English.

TITLE: A gravimetric correction meter. Class 42, No. 190597 [announced by the Kazakh Affiliate of the All-Union Scientific Research Institute of Exploratory Geophysics (Kazakhskiy filial Vsesoyuznogo nauchno-issledovatel'skogo instituta razvedochnoy geofiziki)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 2, 1967, 94-95

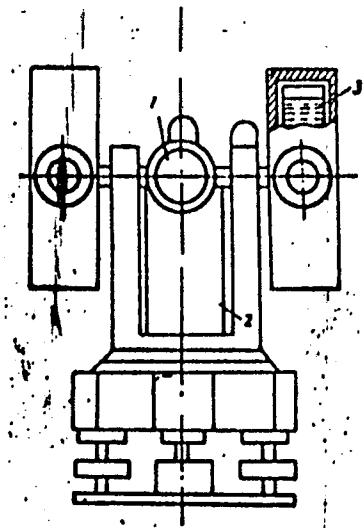

TOPIC TAGS: gravimeter, error correction

ABSTRACT: This Author's Certificate introduces a gravimetric correction meter based on Author's Certificate No. 167047. The instrument is designed for a wider distance measurement range, measurement of corrections during operation with gravitational variometers and gradiometers and also for increased productivity. The unit contains a range finder, a device for automatic summation of the quantities measured and correction scales in gravitational force derivative units.

TITLE: A gravitational "slope meter"

SOURCE: Razvedochnaya geofizika, no. 8, 1965, 114-118

TOPIC TAGS: gravimetric instrument, gravimetric survey, gravity slope meter

ABSTRACT: A gravity "slope meter" ("eklimetr") has been developed which permits the determination of corrections to the vertical component of local values of gravity acceleration within a radius of 50 m of a station when large-scale topographic maps are unavailable. This instrument is described as being more useful than the levels generally in use because measurements are read directly in milligals and can be made on any slope even when it is too steep for using levels; survey personnel can be reduced, and heavy leveling rods can be replaced by light stakes. The instrument (see Fig. 1) has the following components: 1 - A tribrach for horizontalizing the instrument and attaching it to a tripod; 2 - a graduated circle with an alidade for azimuthal orientations for eight principal directions; the alidade has a reticle; 3 - columns supporting the axis of the telescope, the drum casing, and the pendulum drum with its plumb bob; 4 - a telescope used to point the instrument on the stake marks and connected rigidly to the drum casing; 5 - a pendulum drum with correction

ACC NR: AT6004105

(its height equal to the height of the instrument), the drum casing, along with its reading device, rotates with the telescope. The drum and its scales remain in the same position because of the plumb bob. Consequently, the drum casing graduation is above the corresponding value of the correction for the relief effect for different slope angles. The drum has 4 scales for the first 4 zones (0-2 m, 2-10 m, 10-20 m, and 20-50 m). The scale divisions are in 0.001 mgl intervals. The experimental model has scales divided for corrections for slope angles up to  $50^\circ$ . The diameter of the drum and the graduated circle is 100 mm, the diameter of the alidade is 95 mm, the value of scale divisions of the level is 6', the accuracy of slope measurement is 9', the accuracy of measurements of corrections in one direction is 0.001 mgl, and the weight of the instrument is 3 kg. Instructions are given for checking the alignment and adjustment of the instrument. Field tests indicated that an 8-ray pattern with 4 zones ensured corrections with an accuracy of 0.01 mgl even in complex relief, satisfying requirements for high-precision gravimetric surveys. Orig. art. has: 4 figures and 1 table.

"Effect of Pharmacological Agents on the Elimination of  $^{198}\text{Au}$ "

Sofia, Eksperimentalna Meditsina i Morfologiya, Vol 5, No. 3, 1966, pp 160-165

Abstract: The effects of EDTA, dithiopropanol, sodium ethylxanthogenate, hydrochlorothiazide (a saluretic for peroral administration), and the sodium salt of dehydrocholic acid (decholin) on the elimination of  $^{198}\text{Au}$  were studied in mice in which this radioisotope had been injected intraperitoneally. The decrease in the total  $\gamma$ -activity caused by injection of  $^{198}\text{Au}$  was measured. It was established that EDTA, dithiopropanol, and decholin increased the elimination of the radioisotope, while hydrochlorothiazide and sodium ethylxanthogenate had no effect. It was found in experiments on rats that EDTA and dithiopropanol promoted accumulation of  $^{198}\text{Au}$  in the spleen, hydrochlorothiazide accelerated accumulation of  $^{198}\text{Au}$  in the liver, and EDTA lowered the content of  $^{198}\text{Au}$  in the kidneys. It was established in former work by the authors that the effect of garlic in facilitating elimination of  $^{198}\text{Au}$  was also associated with increased accumulation of this radioisotope in the spleen. The results indicated that the effect of substances in eliminating radioisotopes may be rendered valueless by selective accumulation of the radioisotopes in some organs under the influence of these substances. Tables, 2 references (both Bulgarian), Russian and English summaries.

"Effect of Some Psychopharmacological Agents on the Incorporation of  $^{35}\text{S}$ -Methionine in the Cytoplasm"

Sofia, Suvremenno Meditsina, Vol 17, No 6, 1966, pp 461-470

**Abstract:** By applying histoautoradiography, the effect of psychopharmacological agents on the incorporation of  $^{35}\text{S}$ -methionine into cytoplasm was studied in experiments on rats and mice. It was established that the psychoanaleptic methylphenidate increased, while the neuroleptic chloropromazine reduced the incorporation of  $^{35}\text{S}$ -methionine into the cytoplasm of the cells of the brain and liver. Centrophenoxin reduced incorporation of  $^{35}\text{S}$ -methionine into the cytoplasm of liver cells. Serotonin reduced incorporation of  $^{35}\text{S}$ -methionine into liver cells while increasing incorporation into renal convoluted tubules. Methisergid, which has antiserotonin activity, increased incorporation of  $^{35}\text{S}$ -methionine into all organs investigated (liver, spleen, and kidneys), while psilocibin, which also exhibits antiserotonin activity, increased incorporation into liver cells only. Combined administration of serotonin and methisergid or psilocibin disclosed a distinct antagonistic effect of the two types of substances on the incorporation of  $^{35}\text{S}$ -methionine. The results indicated that psychopharmacological agents exert an effect on protein metabolism.

"Influence of Garlic on the Elimination of Au-198 and Its Accumulation in Some Organs."

Sofia, Rentgenologiya i Radiologiya, Vol 5, No 2, 1966, pp 89-93

Abstract [authors' Russian and English summaries, modified]: An experiment with 17 white mice (nine test animals and 8 controls) showed that garlic juice in peroral application causes a faster reduction of the total activity of the injected Au-198. In an experiment with 24 rats (12 test animals and 12 controls) on the fifth day after the injection of the gold, a statistically significance lower activity of the rats' spleens was found after treatment with garlic in comparison with the control group. These results permit the conclusion that garlic has an eliminating influence upon radioactive gold. The authors attempt to explain this action of garlic by its content of reactive sulfuric compounds and its activating influence upon the reticuloendothelium. One Bulgarian reference.

Manuscript received in Oct 65.
